Association of Video Game Use With Body Mass Index and Other Energy-Balance Behaviors in Children.

Pro

Primary research

2020

[JAMA pediatrics](#)

Association of **Video Game** Use With Body Mass Index and Other Energy-Balance Behaviors in **Children** . **Childhood obesity** is one of the biggest public health threats facing the UK, and **video game** use is considered a risk behavior for **obesity** among **children** . However, few studies have explored the prospective association between **video game** use and body mass index (BMI) or the potential mediators by irregular bedtimes and higher consumption of sugar-sweetened beverages. Future interventions to prevent **childhood obesity** should incorporate health promotion in mainstream **video games** to target **children** most at risk

Acute effects of video-game playing versus television viewing on stress markers and food intake in overweight and obese young men: A randomised controlled trial.

Primary research

2018

[Appetite](#)

[Controlled trial quality: uncertain](#)

Acute effects of **video - game** playing versus television viewing on stress markers and food intake in **overweight** and **obese** young men: A randomised controlled trial. Sedentary or near-sedentary activities are associated with **overweight / obesity** in epidemiological studies. This has traditionally been attributed to physical activity displacement. A little-explored area is whether behavioural stresses alter sensations of appetite and eating behaviour. We examined whether behaviours conducted seated (television viewing, **video gaming**) induce different eating patterns, associated with differential levels of stress response. We conducted a randomized controlled trial in 72 **overweight / obese** adult males, assigned to three groups (24 per group): (i) non-violent television (control group); (ii) non-violent

a control group and the other intervention group. The randomization will be made by school. The intervention group will perform the physical exercise through the active **video game**, three times a week, for 50 minutes, during 8 weeks. Reassessments will be performed before and after the intervention to evaluate the outcome variables. Condition or disease Intervention/treatment Phase **Overweight** and **Obesity** Impact of Active **Video Game** on Cardiorespiratory, Macro and Microcirculation Function of Adolescents With **Overweight** Impact of Active **Video**

More than tuskegee: what are we missing when discussing Covid vaccine hesitancy? More than Tuskegee: What Are We Missing When Discussing COVID Vaccine Hesitancy? – Clinical Correlations Search More than Tuskegee: What Are We Missing When Discussing COVID Vaccine Hesitancy? October 14, 2021 5 min read By Joachner Philippe Peer Reviewed Ms. G was a 44-year-old African American woman with a history and their Black patients at the microscopic level and reflects the even wider rift between the medical community and the Black community. The patient went on to expound on more concerns that she had regarding the COVID vaccine . She felt like she could not trust the deluge of conflicting information released by experts regarding the safety and efficacy of the vaccine. We attempted to clarify the misinformation
